Figures are approximation as error correction and transcription still ongoing. There were a large body of tests conducted on food samples of “unknown” origin. I suspect these represent samples of foods sold in bulk without packaging in stores that have no marking on country of origin but that these were all likely to be local produce (from Canada). Therefore I have added them with identified Canadian samples, and called the origin of the combined lot as Canada+. Because of the high sample and test numbers for Canada+ and USA, the world average is greatly influenced by these two nations.
